A stress and strain tester is an experimental instrument used to measure the stress and strain properties of a material when it is stressed or loaded. It is usually used in the research of mechanical properties of materials, quality control and materials engineering and other fields. Stress is the internal reaction of an object after it is subjected to force, expressed as the force per unit area. Strain is the deformation or deformation of an object under a force, expressed as a change per unit length. Stress and strain testers determine the mechanical properties of materials by applying a force or load to a specimen and measuring the deformation of the specimen.
