A transdermal contraceptive patch, often simply referred to as a contraceptive patch, is a birth control method that provides hormonal contraception through the skin. It is a convenient and reversible form of contraception for people who prefer not to take oral contraceptive pills or use other birth control methods.

How it Works:The transdermal contraceptive patch is designed to release hormones into the body through the skin. It typically contains two synthetic hormones: estrogen and progestin.

Using a transdermal contraceptive patch typically involves the following steps:

Placement: The patch is a small, adhesive square or rectangle that is applied directly to the skin. It is usually placed on the buttocks, abdomen, upper torso, or outer arm. It should not be applied to the breasts or any area with cuts, irritation, or lotions.

Change Schedule: Depending on the specific brand and type of patch, it needs to be changed once a week for three weeks in a row, followed by a one-week patch-free period.

Cycle Continuation: After the patch-free week, a new cycle begins with the application of a fresh patch. This cycle continues as long as contraception is desired.
