The global Tube Decapping and Capping System market size is predicted to grow from US$ 31750 million in 2025 to US$ 42000 million in 2031; it is expected to grow at a CAGR of 4.8% from 2025 to 2031.

Tube decapping and capping system is a machine or equipment used in laboratories or medical facilities to automate the process of removing caps from tubes and then recapping them. This system is commonly used in various applications, such as sample preparation, specimen handling, and storage.

The decapping and capping system typically consists of a robotic arm or mechanism that can precisely grip and remove the caps from tubes. It may use different methods to achieve this, such as mechanical gripping, magnetic force, or vacuum suction.

The system is designed to handle a large number of tubes simultaneously, improving efficiency and reducing the risk of contamination or human error. It can be programmed to decap and recap tubes of different sizes and types, including screw-cap tubes, snap-cap tubes, or push-cap tubes.

Tube decapping and capping systems are often integrated with other laboratory automation systems, such as liquid handling robots or sample storage systems. This allows for seamless integration and automation of the entire workflow, from sample collection to analysis or storage.
