The global Underground Compressed Air Energy Storage market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Underground Compressed Air Energy Storage is an approach to storing electrical energy produced at times of excess supply and making it available again at times of high-demand. In a Underground Compressed Air Energy Storage system, electrical energy is used to compress air which is stored in sealed underground caverns and back-produced when required with energy recovered in a gas turbine.

Underground Compressed Air Energy Storage is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods.
