The vehicle control unit for pure electric vehicle is the core component of the vehicle's electronic control system, essentially acting as the vehicle's "brain." It is primarily responsible for the comprehensive coordination and control of the electric drive system (drive motor, battery, regenerative braking, etc.) and other vehicle control modules (such as the Battery Management System (BMS), Microcontroller Unit (MCU), and air conditioning system). By real-time acquisition and analysis of vehicle operating status, driver intentions, and external environmental signals, the VCU performs functions such as power distribution, energy optimization, driving mode switching, and vehicle safety protection, thereby ensuring the efficient, safe, and stable operation of the pure electric vehicle. In 2024, global sales of vehicle control units for pure electric vehicles reached 11.07 million units, with an average selling price of $285 per unit. Large-scale enterprises producing vehicle control units for pure electric vehicles have a single-line production capacity of approximately 100,000 units per year. The average gross profit margin in the vehicle control unit for pure electric vehicles industry is between 25% and 40%.

The upstream of the vehicle control unit (VCU) industry chain for pure electric vehicles mainly includes suppliers of electronic components such as control chips, power devices, sensors, communication modules, wiring harnesses, connectors, and structural parts. It also involves embedded software algorithms and system platform developers. The core aspect lies in the research and development and supply of high-performance automotive-grade chips and functional safety software. The downstream primarily
