SUMMARY

Centerless grinding is a machining process that uses abrasive cutting to remove material from a work piece. Centerless grinding differs from centered grinding operations in that no spindle or fixture is used to locate and secure the work piece; the work piece is secured between two rotary grinding wheels, and the speed of their rotation relative to each other determines the rate at which material is removed from the work piece.

The global Centerless Grinding market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
