SUMMARY

Anesthesia is a balance between the amount of anesthetic drug(s) administered and the state of arousal of the patient. Given that the intensity of surgical stimulation varies throughout surgery, and the hemodynamic effects of the anesthetic drugs may limit the amount that can be given safely, it is not uncommon for there to be critical imbalances between anesthetic requirement and anesthetic drug administration. Under dosing may be because of equipment failure or error may occur. Conversely, inappropriate titration of the hypnotic components, leading to an excessive depth of anesthesia (DoA), might compromise patient outcome. Depth of anesthesia monitors might help to individualize anesthesia by permitting accurate drug administration against the measured state of arousal of the patient. In addition, the avoidance of awareness or excessive anesthetic depth might result in improved patient outcomes. Various depth of anesthesia monitors based on processed analysis of the EEG or mid-latency auditory-evoked potentials are commercially available as surrogate measures of anesthetic drug effect. However, not all of them are validated to the same extent.

The global Depth of Anesthesia Monitor market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
