### SUMMARY

Extracorporeal Shock Wave Therapy (ESWT) is a noninvasive, FDA-approved technology that uses shock waves to treat chronic, painful conditions of the musculoskeletal system. The procedure has also proven to be extremely effective for improved penile function. ESWT produces intense, short energy waves that travel faster than the speed of sound. This shock wave, in turn, generates pulses of high pressure sound that travel through the skin, initiating tissue repair. ESWT can often heal even chronic conditions that the body has previously been unable to repair on its own. The weak shock waves interact with deep tissue where they cause mechanical stress and microtrauma that stimulate the body to jump into action.

The global Extracorporeal Shock Wave Therapy Device market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
