SUMMARY

The biosensor is a sensing device, which consists of a combination of a specific biological element and a transducer. Biosensors are defined as analytical devices that convert a biological response into electrical signal and assist in measuring a wide spectrum of analytes including organic compounds, gases, bacteria and others. There are three main parts of a biosensor: (i) the biological recognition elements that differentiate the target molecules in the presence of various chemicals, (ii) a transducer that converts the biorecognition event into a measurable signal, and (iii) a signal processing system that converts the signal into a readable form. Glucose biosensors are normally used to detect concentration of glucose in diabetic patients. Bio-elements such as proteins including enzymes, nucleic acids and others are used as biosensors in order to analyze the concentration of glucose in an individual.

The global Glucose Biosensors market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
