SUMMARY

Liquefied natural gas (LNG) is natural gas (predominantly methane, CH₄) that has been converted to liquid form for ease of storage or transport. LNG is an attractive fuel choice for many vessels because it exceeds the air quality standards set forth. It takes up about 1/600th the volume of natural gas in the gaseous state. It is odorless, colorless, non-toxic and non-corrosive. Hazards include flammability after vaporization into a gaseous state, freezing and asphyxia. The liquefaction process involves removal of certain components, such as dust, acid gases, helium, water, and heavy hydrocarbons, which could cause difficulty downstream. The natural gas is then condensed into a liquid at close to atmospheric pressure by cooling it to approximately 162 °C (260 °F); maximum transport pressure is set at around 25 KPa (4 psi). In this report, LNG bunkering only refers to LNG bunkering fuel.

The global LNG Bunkering market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
