SUMMARY

An oral syringe is used to dispense liquid medicine into the mouth. It's made up of three main parts: a straw like stopper, the barrel or body and the plunger; some oral syringes also have a cap that fits on the tip of the barrel. An oral syringe has measurement markings on its barrel. It looks almost identical to a hypodermic syringe used to inject medicine under the skin, but uses no needle. Instead, oral syringes have an opening that allows liquid medications to be dispensed into the mouth.

The global Oral Syringes market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
