SUMMARY

A RF Mixer is a non linear component that is used to up-convert or down-convert the frequency of an input signal. RF Mixers mix the frequency of an input signal (RF) with that of a Local Oscillator (LO) to produce two new signals at the sum $RF + LO$ and difference $RF - LO$ of the original frequencies. RF Mixers are primarily used in receivers to down-convert a high RF frequency to a lower frequency which is typically easier to process. For example a 2.4 GHz signal input to a receiver can be down-converted to 10 MHz to further process. Similarly it is used in transmitters when up-conversion to a particular higher frequency is required.

The global RF Mixers market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
