SUMMARY

A triazine is class of nitrogen-containing heterocycles. The parent molecules' molecular formula is C₃H₃N₃. They exist in three isomeric forms, 1,3,5-triazines being common. MMA Triazine is a cyclic tertiary triamine. It is mainly used as a scavenger for sour gases like H₂S and mercaptans in gaseous or liquid hydrocarbon streams. MEA-triazine is the most commonly used chemistry for applications requiring a non-regenerative H₂S scavenger. Other chemistries are available (MMA-triazine, glyoxal, zinc-based, iron-based, and others) but MEA-triazine has the highest market share because it is the lowest cost in use solution. Triazines are low cost in use despite the fact that the molar efficiency of the chemistry in capturing H₂S is significantly below theoretical maximum efficiency.

The global Triazine market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
