SUMMARY

Ultrasonic welding is the joining or reforming of thermoplastics or other materials through the use of heat generated from high-frequency mechanical motion. It is accomplished by converting high-frequency electrical energy into high-frequency mechanical motion. That mechanical motion, along with applied force, creates frictional heat at the plastic or other materials components' mating surfaces (joint area) so the material will melt and form a molecular bond between the parts. Ultrasonic welder is the equipment used in the Ultrasonic plastic welding process widely.

The global Ultrasonic Welder market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
