SUMMARY

Zinc phosphate ($Zn_3(PO_4)_2$) is an inorganic chemical compound used as a corrosion resistant coating on metal surfaces either as part of an electroplating process or applied as a primer pigment (see also red lead). It has largely displaced toxic materials based on lead or chromium, and by 2006 it had become the most commonly used corrosion inhibitor. Zinc phosphate coats better on a crystalline structure than bare metal, so a seeding agent is often used as a pre-treatment. One common agent is sodium pyrophosphate.

The global Zinc Phosphate market is expected to reach xxx Million USD by 2025, with a CAGR of xx% from 2020 to 2025.
