SUMMARY

The biosensor is a sensing device, which consists of a combination of a specific biological element and a transducer. Biosensors are defined as analytical devices that convert a biological response into electrical signal and assist in measuring a wide spectrum of analytes including organic compounds, gases, bacteria and others. There are three main parts of a biosensor: (i) the biological recognition elements that differentiate the target molecules in the presence of various chemicals, (ii) a transducer that converts the biorecognition event into a measurable signal, and (iii) a signal processing system that converts the signal into a readable form. Glucose biosensors are normally used to detect concentration of glucose in diabetic patients. Bio-elements such as proteins including enzymes, nucleic acids and others are used as biosensors in order to analyze the concentration of glucose in an individual.
