Summary

Aramids are a family of nylons, which are contraction of aromatic and polyamide. It is man-made high-performance fiber, with molecules that are characterized by relatively rigid polymer chains. These molecules are linked by strong hydrogen bonds that transfer mechanical stress very efficiently, making it possible to use chains of relatively low molecular weight. An aramid is a polyamide where at least 85% of the amide bonds are attached to aromatic rings. Aramid is a class of heat-resistant and strong synthetic fibers. It is used in aerospace and military applications, for ballistic-rated body armor fabric and ballistic composites, in bicycle tires, and as an asbestos substitute. The name is a portmanteau of "aromatic polyamide". BISFA defines these fibers as "fiber composed of linear macromolecules made up of aromatic groups joined by amide or imide linkages
