SUMMARY

Artemisinin is a sesquiterpene lactone containing an unusual peroxide bridge which possesses the most rapid action of all current drugs against Plasmodium falciparum malaria. It is isolated from the plant Artemisia annua, sweet wormwood, an herb employed in Chinese traditional medicine. It can now also be produced using genetically engineered yeast. Because artemisinin itself has physical properties such as poor bioavailability that limit its effectiveness, semisynthetic derivatives of artemisinin have been developed. These include: Artesunate, Artemether, Dihydroartemisinin, Artelinic acid, Artemotil. Treatments containing an artemisinin derivative (artemisinin-combination therapies, ACTs) are now standard treatment worldwide for P. falciparum malaria. This report analyses the data of API, including the price, production, consumption and other information.

This report describes the development of the industry by upstream & downstream, industry overall and development, key companies, as well as type segment & market application and so on, and makes a scientific prediction for the development industry prospects on the basis of analysis, finally, analyzes opportunities for investment in the industry at the end of the report.
