SUMMARY

The rationale behind using Iron chelation therapy is removing the increased iron burden specifically labile cell iron (LCI) to minimize production of reactive oxygen species (ROS) thereby decreasing cellular and organ damage. Patients most likely to benefit from chelation therapy include those with low or intermediate-1 IPSS risk MDS who have a long-life expectancy and are anticipated to receive more than 20 red blood cell transfusions and/or whose serum ferritin level is >1000 µg/L. Chelation therapy efficacy can be monitored by monitoring trends and levels of serum ferritin.
