## Abstracts

### Summary

KLH, which can be used as an active pharmaceutical ingredient (“API”), is a very large, high molecular weight, oxygen-carrying glycoprotein made of millions of atoms. There are two KLH subunit forms, KLH1 and KLH2, each composed of seven or eight functional units, with each functional unit having an oxygen binding site of two copper atoms. Keyhole limpet hemocyanin is an extremely large, heterogeneous glycosylated protein consisting of subunits with a molecular weight of 350,000 and 390,000 in aggregates with molecular weights of 4,500,000-13,000,000. Each domain of a KLH subunit contains two copper atoms that together bind a single oxygen molecule (O<sub>2</sub>). The KLH protein is potentially immunogenic yet safe in humans and is therefore highly prized as a vaccine carrier protein.
