Summary

A boat's steering wheel is part of the helm that connects to a mechanical, electric, or hydraulic system to assist in turning the boat. Boats with outboard motors steer with a wheel which rotates the entire drive unit; inboards sometimes use a pod with an attached propeller; personal watercraft use jet drives with an impeller to force water into a nozzle that the operator can turn to the desired course. Some modern ships replace the wheel with a toggle that remotely controls an electric or hydraulic rudder drive, with an indicator that shows the rudder angle in real time to the helmsman.
