Abstracts

Summary

Metallographic Cutting Machine is used for cutting the metallographic specimens with irregular shapes such as cylinder, polygon etc., so as to observe the metallographic and lithofacies structure of the material. Most metallographic samples need to be cut to the area of interest and for easy handling. Depending upon the material, the cutting operation can be done by abrasive cutting wheels (metals and metal matrix composites), or diamond cutting wheels (ceramics, electronics, biomaterials, minerals).
