Summary

MVR stands for Mechanical Vapor Recompression and is an evaporator driven by mechanical energy or electricity. It is a technology by circulating utilization of secondary steam energy generated from evaporator itself. Mechanical vapor recompression uses the secondary steam which generated from evaporator and increases its pressure, temperature and enthalpy through compressor and sends it to the heating room of evaporator to be used as heat steam which the feed liquid can maintain boiling condition and the heat steam will become condensing water. Thus the primary steam which will be disposed can be used sufficiently and increases the heat efficiency, decreases energy consumption and reduces pollution.
