Summary

Normally, core body temperature falls between 96.8 °F and 99.5 °F. Patient temperature management enables treatment to a patient by maintaining and achieving core body temperature (normothermia) to avoid hypothermia or hyperthermia. Hypothermia can cause discomfort, prolong healing time, and increase risks during surgeries, while hyperthermia affects the central nervous system. Therefore, hospitals and other healthcare centers adopt patient temperature management systems to control and monitor the core body temperature of a patient.
