SUMMARY

A thermal fuse is an emergency device used to prevent electrical appliances from overheating. Like an electrical fuse, a thermal fuse completely burn outs when the machine it is attached to gets beyond its safety level. Unlike an electrical fuse, a thermal fuse is melted by excessive heat instead of shorted out by excessive current. A thermal fuse uses a fusible link-two pieces of metal which are attached together by a substance designed to melt at a particular temperature. Under normal circumstances, current runs through between the two plates, running the appliance. When it gets too hot, however, the fusible alloy-the substance which holds the pieces together-melts, and they spring apart, turning off the current.
