SNAPSHOT

Virus filtration (VF) is a key step in an overall viral clearance process since it has been demonstrated to effectively clear a wide range of mammalian viruses with a log reduction value (LRV) > 4 . The potential to achieve higher LRV from virus retentive filters has historically been examined using bacteriophage surrogates, which commonly demonstrated a potential of > 9 LRV when using high titer spikes (e.g. 10^{10} PFU/mL). However, as the filter loading increases, one typically experiences significant decreases in performance and LRV.

The global Virus Filtration market will reach xxx Million USD in 2017. The report begins from overview of Industry Chain structure, and describes industry environment, then analyses market size and forecast of Virus Filtration by product, region and application, in addition, this report introduces market competition situation among the companies and company profile, besides, market price analysis and value chain features are covered in this report.
