Summary

The total 25-hydroxyvitamin D (25-OH-VitD) level (the sum of 25-OH-vitamin D2 and 25-OH-vitamin D3) is the appropriate indicator of vitamin D body stores. Although there is no universal consensus about a treatment cut point, studies suggest 25 to 35 ng/mL as the minimal concentration of 25-OH-VitD needed to avoid the adverse effects of deficiency.^{2,3,4} By contrast, population reference ranges do not correspond with healthy ranges. In northern latitude locations in particular, one-third of the population may have vitamin D levels less than 25 ng/mL at the end of winter.
