Abstracts

A bushing or rubber bushing is a type of vibration isolator. It provides an interface between two parts, damping the energy transmitted through the bushing. A common application is in vehicle suspension systems, where a bushing made of rubber (or, more often, synthetic rubber or polyurethane) separates the faces of two metal objects while allowing a certain amount of movement. This movement allows the suspension parts to move freely, for example, when traveling over a large bump, while minimizing transmission of noise and small vibrations through to the chassis of the vehicle. A rubber bushing may also be described as a flexible mounting or antivibration mounting.

Along the increasing production of vehicles, worldwide automobile production exceed 90 million in 2015, and 93 million automobiles expected be produced in 2016; some 68.56 million cars were produced worldwide and about 22.12 million such vehicles were produced globally in 2015, under increasing production of vehicles, global Automotive Bushing market is expected to register a CAGR of 4.7% over 2016-2020.

Geographically, the Asia Pacific is largest market for the Automotive Bushing globally as where is the largest car market in both production and demand, the Asia Pacific is expecting to grow at highest CAGR through 2020, the region followed by Europe, the Europe is to witness to register a CAGR of 4.1 for the forecast period.

On the basis of type, the main advantage of a bushing, as compared to a solid connection, is less noise and vibrations are transmitted. Another advantage is that they require little to no lubrication.
