## Abstracts

The purpose of calibration is to compare the measurement standard, evaluate the indication error of the measuring device, and ensure the accuracy of the measurement. It belongs to a set of operations that trace the source of the measurement from the bottom up. The evaluation of this indication error should be made in accordance with the organization's calibration procedures, carried out according to the calibration cycle, and the calibration records and calibration marks should be made. In addition to evaluating the indication error of the measuring device and determining the related measurement characteristics, the calibration result can also be expressed as a correction value or a calibration factor to specifically guide the operation of the measurement process. For example, a caliper used by a machining organization is found to be 0.2mm larger than the measurement standard through calibration. This data can be used as a correction value. The calibration mark and record indicate that the calibrated value is larger than the standard. The value of 0.2mm. In the process of using this measuring instrument (caliper) for physical measurement, subtracting the correction value greater than 0.2mm will be the actual measurement value of the physical measurement. As long as the purpose of traceability can be achieved and the indication error of the measuring instrument is clearly understood, the purpose of calibration is achieved.

Calibration instruments are tools and instruments used in physical calibration, calibration, and testing. In the context of China-US trade war and COVID-19 epidemic, it will have a big influence on this market.
