## Abstracts

Ultrafiltration (UF) is a variety of membrane filtration in which forces like pressure or concentration gradients lead to a separation through a semipermeable membrane. Suspended solids and solutes of high molecular weight are retained in the so-called retentate, while water and low molecular weight solutes pass through the membrane in the permeate (filtrate). Hollow fiber ultrafiltration membranes incorporate high strength hollow fibers which deliver superior performance without the risk of fiber breaks. Hollow fibre UF membranes are micro-thin fibres with porous walls. The tubules (fibres) are around 1mm diameter. The pores that allow water to flow through the fibres are up to 0.1 microns in size. This is 600-800 times thinner than human hair. Smaller than most impurities to pass through. In the context of China-US trade war and COVID-19 epidemic, it will have a big influence on this market.
