Abstracts

Plant antifreeze are chemicals, which reduce the freezing point of water inside the tissues of plants. These chemicals help plants to endure temperatures 2.2 to 9.4F colder than usual, depending upon the species. Antifreeze chemicals such as ethylene glycol, propylene glycol, glycerin, and others stimulate plants to produce antifreeze proteins and antifreeze amino acids to prevent itself against cold and frost temporarily. In the context of China-US trade war and global economic volatility and uncertainty, it will have a big influence on this market. Plant Antifreeze Report by Material, Application, and Geography – Global Forecast to 2025 is a professional and comprehensive research report on the world's major regional market conditions, focusing on the main regions (North America, Europe and Asia-Pacific) and the main countries (United States, Germany, United Kingdom, Japan, South Korea and China).
