## Abstracts

The soaking furnace is a pit furnace that heats or keeps the steel ingot for a certain period of time before blooming, and makes the internal temperature of the steel ingot uniform through thermal diffusion, which is suitable for metal plastic processing. The furnace is a rectangular parallelepiped, and steel ingots are placed vertically in the furnace. Usually several furnace pits form a group, sharing a set of control system. Most use gas fuel for heating, but heavy oil can also be used. The soaking furnace works periodically, and its temperature system and heating system change with time. In the context of China-US trade war and COVID-19 epidemic, it will have a big influence on this market.
