Abstracts

Anti-lock braking system is the safety braking system that is used in vehicles to prevent it from skidding and to prevent the vehicle from locking up the wheel during braking; thereby, maintaining tractive contact with the surface of the road. It allows wheels of a vehicle to maintain dynamic contact with the road surface, which is proportional to the braking inputs given by the driver. It improves vehicle control and reduces stopping distance on both dry and slippery surfaces. The automobile companies have equipped their vehicles with anti-lock braking system, traction control system (TCS), electronic brake force distribution (EBD), and electronic stability control (ESC) to offer advanced safety features and improve stability control and safety on difficult terrains.

Anti-lock braking system is anticipated to witness significant growth over the years, owing to rise in awareness among consumers about safer driving system, increase in technological advancement, and implementation of stringent government regulations.

The global anti-lock braking system market is segmented based on sub-system type, vehicle type, and region. Based on sub-system type, the market is categorized into sensors, electronic control unit (ECU), and hydraulic unit.
