Abstracts

The global anti-viral therapies market was valued at \$38,316.5 million in 2018, and is projected to reach \$46,213.4 million by 2026 registering a CAGR of 2.4% from 2019 to 2026. Antiviral drugs belong to the class of medicines, which are used for treating viral infections, such as HIV, herpes, hepatitis, and influenza. These drugs are generally administered in the form of vaccines. In addition, most of these drugs are used for specific viral infections, while a few (broad-spectrum antiviral drugs) are effective against a wide range of viruses.

The global antiviral therapies market is majorly driven by increase in the incidence rate of viral infections. In addition, rise in R&D activities and development of newer & advanced formulations, such as vaccines and combination therapy along with pipeline products, are expected to fuel the market growth. However, high cost involved in the treatment and rise in demand for alternative medicines such as naturopathy and homeopathy are likely to restrain the market growth. On the contrary, development and approvals of combination therapies and growth opportunities in the emerging economies of Asia-Pacific and LAMEA regions are anticipated to provide numerous opportunities for the market growth during the forecast period.

The global antiviral therapies market is segmented on the basis of application, type,

mechanism of action, and region. Based on application, the market is categorized into HIV, hepatitis, herpes, influenza, and other viral diseases. On the basis of type, it is classified into generic drugs and branded drugs. By mechanism of action, it is divided into nucleotide polymerase inhibitors, reverse transcriptase inhibitors, protease inhibitors, and others. Region wise, the market is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
