Abstracts

Enterprise resource planning (ERP) is a software that enables organizations to manage and automate their business processes. This software has been widely used for back-office operations, which include inventory control production, order management, accounting, human resource (HR), and others. An ERP software system comprises several software modules, and each ERP module is focused on a particular departmental area, such as inventory control, finance, material purchasing, marketing, HR, and accounting. These modules can be customized according to the business requirement of the organization. In addition, ERPs have witnessed increased adoption, as they offer effective planning and streamlining of data under one platform, which helps in regulating operational costs, increase sales, and enhance decision-making. With the growing focus of modern SMEs toward improving their operational and business process efficiency, the adoption of ERP software is expected to increase in the upcoming years. This will subsequently fuel the growth of the Asia-Pacific ERP software

market.
