Abstracts

Auto dimming mirrors are one of the most integral part of vehicle safety accessories. Auto dimming mirrors utilize exclusive electrochromic technology to dim the proportion of glare coming from the headlamps of tailing vehicles. Auto dimming mirrors consist of an ambient sensor and a glare sensor, which are connected to a microprocessor. They then detect any glare coming from a source behind and accordingly send a charge through the electrochromic material present in the auto dimming mirror. The electrochromic material, which is placed in between two electrically conductive glasses make the mirrors turn dark in proportion to the glare. The intensity of light is detected by two sensors placed in the inside rear-view mirror of a vehicle. The dimming of exterior mirror is controlled by sensors placed inside the interior mirrors, which becomes active when brightness gets low.

Auto dimming mirror is anticipated to witness significant growth over the years, owing to increasing demand for advanced features coupled with growing automotive industry and increasing need for safety in automobiles.

The global auto dimming mirror market is segmented into application, vehicle type, and fuel type and region. Depending on application, the market is divided into inside rear-view mirror, and outside rear-view mirror. On the basis of vehicle type, it is categorized into passenger cars and commercial vehicle. Fuel type are categorized as internal
