Abstracts

The global bone densitometers market size was valued at \$34,690 thousand in 2016, and is expected to reach \$44,218 thousand by 2023, growing at a CAGR of 3.3% from 2017 to 2023. Bone densitometry is technique that is used to measure the density and mineral content of bones to check decreased bone mass, a clinical condition that results in brittle bones, which possess a high probability of getting fractured. The technique is predominantly used for the diagnosis of osteoporosis and determination of fracture risk. High incidence of disorders that lead to loss of bone density, growth of the geriatric population, increase in technological advancements, and benefits offered by dual energy X-ray absorptiometry (DEXA) devices drive the growth of the global bone densitometer market. However, high cost of bone densitometers and risks associated with them are expected to impede the market growth. On the contrary, health initiatives to promote awareness regarding osteoporosis are expected to offer potential opportunities for market expansion.

The global bone densitometers market is segmented on the basis of application, technology, end user, and region. Based on application, the market is bifurcated into central scan and peripheral scan. The technology segment is categorized into DEXA, ultrasound, and other technologies. Bone densitometers are used in hospitals, clinics, and other medical settings. Regionally, the market is analyzed across North America (U.S., Canada, and Mexico), Europe (Germany, France, Italy, UK, Spain, and rest of Europe), Asia-Pacific (China, Japan, Australia, India, South Korea, and rest of Asia-Pacific), and LAMEA (Brazil, South Africa, Saudi Arabia, and rest of LAMEA).
