## **Abstracts**

Breast biopsy is a preliminary test that detects the area of an abnormal tissue growth or diagnoses the presence of cancerous cells. Defects or abnormalities are detected in the cell with the help of devices, such as vacuum-assisted biopsy, core needle biopsy, and fine needle biopsy. Moreover, assist the surgeons or radiologist performing the biopsy and using specialized imaging equipment, such as ultrasound, mammography-guided stereotactic biopsy that employs x-ray, and others.

The breast biopsy market was valued at \$976.7 million in 2016, and is projected to reach at \$1,420 million by 2023, growing at a CAGR of 5.3% from 2017 to 2023. This is attributed to the growth in incidence of breast cancer, increase in awareness regarding breast cancer screening programs, rise in demand for minimally invasive surgeries for breast biopsy, and new reimbursement guidelines for biopsy procedures in the U.S. However, various regulatory issues and risks of infection in breast biopsy procedures hamper the market growth. The developing countries are expected to offer abundant growth opportunities to the breast biopsy market.

The global breast biopsy market is segmented on the basis of product, image-guided technology, end user, and geography. On the basis of product, it is classified into vacuum-assisted biopsy (VAB), core needle biopsy (CNB), and fine needle aspiration

biopsy (FNAB). Based on image guided technology, it is divided into MRI-guided biopsy, ultrasound guided biopsy, mammography guided stereotactic biopsy, CT-guided biopsy, and others. On the basis of end user, it is bifurcated into diagnostic centers and hospitals. Geographically, it is analyzed across North America, Asia-Pacific, Europe, and LAMEA.
