Clinical Decision Support Platform Market

The clinical decision support platform market was valued at \$1.2 billion in 2023 and is projected to reach \$2.4 billion by 2033, growing at a CAGR of 7.3% from 2024 to 2033.

Clinical decision support platform is a system designed to enhance the delivery of healthcare by refining the decision-making process. The platform compares patient data & health records with the existing database & assessments and provides tailored recommendations. The aim of the platform is to elevate the quality of healthcare delivery through precise diagnoses, optimized treatment plans, reduced errors, and strict adherence to appropriate practices.

Increase in expenditure of healthcare and patient safety across different regions is driving the growth of the clinical decision support platform market. In addition, the clinical decision support platform is witnessing a high demand as it aids in cost savings

by facilitating the optimal usage of resources and reducing the cases of unnecessary hospital readmissions. In the digital era, clinical decision support platforms powered by the properties of AI and deep learning are gaining prominence. AI enables the precise assessment and interpretation of loads of data in a short span of time. Moreover, deep learning complements the attributes of AI through predictive analysis, pattern analysis, and image recognition.

However, the installation and maintenance of the platform, along with the assembly of necessary resources & infrastructure is an expensive process that restrains the growth of the clinical decision support platform market. Furthermore, these platforms remain at a high risk of data breach and cyberattacks, which hampers the market development. For instance, Change Healthcare—an American healthcare company—was targeted t%li%a ransomware attack on February 2024, risking the health data of millions of Americans due t%li%unauthorized access.
