Abstracts

Micronutrients such as copper, iron, zinc, and boron, are considered as essential elements for plant growth and play an important role in balanced crop nutrition. They are essential for plant nutrition along with primary and secondary macronutrients such as nitrogen, phosphorous, potassium, and others. Plants require these in minute quantities. However, deficiency of any one of the micronutrients in soil can limit the growth of plants, even after presence of adequate amounts of all the other nutrients. Unavailability of micronutrients inhibit the critical functions of crops that can lead to abnormality, slow growth, and reduced yield. The requirement of effective fertilizers because of poor soil quality acts as a major driver for the crop micronutrients market. In addition, increase in demand for biofuels due to depleting conventional fuels reserves fuels the growth of the crop micronutrients market.

Increase in population and rise in economy of the developing countries have fueled the consumption of food. In addition, agricultural land is lost after it is being converted for other purposes, such as highways, housing, and factories. Hence, it is important to maintain the nutrient level in crops & soil to enhance the productivity and growth of crops. To produce enough food for population across the globe with available cultivable

land, farmers are incorporating micronutrients with other essential ingredients for agriculture in the form of fertilizers. Chemical fertilizers that consist of micronutrients protect crops from insects as well as UV radiation, and offer increased yield. Moreover, the lack of micronutrients can lead to various diseases in plants such as chlorosis, yellowing of leaves, gummosis, and others, which reduce quality and quantity of plants. Use of micronutrients for various crops such as cereals & grains, fruits & vegetables, pulses, and oilseeds through various application such as fertigation, soil, foliar, seed treatment and others are expected to boost plant immunity, thereby driving the crop micronutrients market.

Factors such as the appeal for quality and uniform crop yield due to the population expansion across the globe and decrease in cultivable land fuel the demand for agricultural micronutrients. However, mining of micronutrient reserves, lack of awareness among farmers in developing countries regarding dosage and proper application of micronutrients are expected to restrain the growth of the global crop micronutrients market during the forecast period. Furthermore, the adoption of new methods of farming for improving productivity will be providing lucrative opportunities for micronutrient fortified products.
