## **Abstracts**

Cladding is defined as a non-loadbearing skin or layer attached to the outside or inside of a building and includes all moisture barriers and siding materials used to cover the exterior of a structure. It is one of the key components where certain material layer is added to provide high performance outer envelope, as well as enhance and transform the existing constructions. Cladding systems are versatile, long lasting, and save energy. They are designed to meet the most demanding aesthetic and functional requirements. Careful assessment and prioritization of each of these roles for each orientation of the building is involved when before any cladding system is finalized.

The global claddings market is segmented based on component type, material, end-use sector, and geography. Based on component type, it is classified into walls, roofs, windows & doors, and others. By material type the claddings market is segmented into masonry & concrete, brick & stone, stucco & EIFS, fiber cement, metal, vinyl, wood, and others. Vinyl cladding accounted for a dominant share of the global claddings market in 2015 and is expected to maintain its position over the forecast period. Vinyl is among one of the most cost effective and durable cladding materials used to create weatherproof barrier for long-lasting and low maintenance aesthetics.

The global claddings market based on end-use sector is categorized into residential and non-residential sectors. The non-residential segment accounted for a larger share of the claddings market in 2015 and is projected to grow at a CAGR of 6.3% over the forecast period. The claddings market growth in the non-residential
