Abstracts

The global graphite market was valued at \$14.3 billion in 2019, and is projected to reach \$21.6 billion by 2027, growing at a CAGR of 5.3% from 2020 to 2027.

Graphite is flexible in nature and has both metallic and non-metallic properties, which makes it appropriate for a diverse range of industrial applications. The non-metallic properties of graphite include high thermal resistance, chemical inertness, and lubricity, while the metallic properties include electrical and thermal conductivity. Graphite is manufactured synthetically using carbon containing raw materials such as tar pitch and petroleum coke. The demand for natural graphite is directly proportional to the growth of the industrial applications, including lubrication, refractories, battery production, and foundry. The refractories segment account for the highest share of around 35.1% in the global graphite market, and is expected to remain a dominant application for consumption of natural graphite throughout the forecast period.

The global graphite market is segmented on the basis of type, application, and region. Depending on type, the market is bifurcated into natural graphite and synthetic graphite. The natural graphite segment is further sub-categorized into flake graphite, amorphous graphite, and vein graphite. The synthetic graphite segment is further classified into graphite electrode, graphite block, carbon fiber, graphite powder, and others. Based on application, the global graphite market is segmented into lubrication, refractories, foundry, battery production, and others. Region wise, the market is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
