## **Abstracts**

The global interbody fusion cage market was valued at \$1,818 million in 2016, and is expected to reach \$2,309 million by 2023 with a CAGR of 3.4% during the forecast period. Interbody fusion cage, also known as spinal cage is an artificial device used in spinal fusion procedures to maintain foraminal height and decompression. The interbody fusion cage is a large, hollow cylinder made up of metals such as titanium, carbon fiber, or allograft femur.

Rise in geriatric population, increase in incidences of spinal injuries and sports injuries, and technological advancements in medical sciences are the key factors that drive the growth of the market. In addition, increased demand for interbody fusion cage surgeries due to advantages that allow the surgeon to directly decompress nerves and reconstruct the spine also fuel the market growth. However, high costs associated with spinal fusion surgeries and increase in disposable incomes in emerging economies are anticipated to restrain the market growth. Further, the introduction of awareness programs regarding the potential benefits of interbody fusion cages and minimally fusion surgeries especially in the developing economies create lucrative opportunities in the market.

The global interbody fusion cage market is segmented based on product, surgery type, end user, and region. Based on product, it is divided into lumbar, cervical, thoraco-lumbar, and thoracic. Based on surgery, it is classified into anterior, posterior, lateral, and transforaminal. Based on end user, it is categorized into hospital, clinic, medical

center, and others. Based on region, it is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
