## **Abstracts**

The global intermittent catheters market was valued at \$1,655.5 million in 2016, and is expected to reach \$2,950.7 million by 2023 with a CAGR of 8.7% during the forecast period. Intermittent catheter is a disposable medical device, which is used to drain the urinary bladder when an individual is unable to do it naturally. Intermittent catheter consists of a drainage bag that assists to capture the urine. These catheters are composed of silicone, PVC, or vinyl or red rubber latex.

The growth of the intermittent catheters market is driven by increase in incidence of urinary incontinence coupled with rise in geriatric population and surge in need for minimally invasive surgeries. In addition, increase in preference of hydrophilic intermittent catheters is expected to supplement the market growth. However, the availability of substitutes of intermittent catheters and lack of awareness towards novel intermittent catheters impede the market growth. On the contrary, innovations in catheters and novel product launches are anticipated to provide lucrative opportunities for the market expansion.

The global intermittent catheters market is segmented based on product, indication, category, end user, and region. On the basis of product, the market is bifurcated into uncoated intermittent catheters and coated intermittent catheters. Coated intermittent catheters are further classified into antimicrobial, hydrophilic, and others. Based on indication, the market is categorized into urinary incontinence, spinal cord injuries, general surgery, and others. By category, it is divided into female length catheter, male length catheters, and kid length catheter. Depending on end user, it is fragmented into hospitals, ambulatory surgical centers, and medical research centers. Region wise, the market is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
