Abstracts

The military software market was valued at \$642.8 billion in 2023 and is estimated to reach \$1,058.71 billion by 2033, exhibiting a CAGR of 5.45% from 2024 to 2033.

Military software consists of specialized computer programs and systems designed for use by the armed forces to support and improve various defense operations. These applications cover areas such as combat missions, intelligence collection, surveillance, communication, logistics, cyber security, training, and command and control functions.

Rise in adoption of military communication systems and rise in investments in advanced warfare technologies are major factors fueling the market growth. Increased focus on network-centric warfare, integration of artificial intelligence (AI) and machine learning (ML) into defense systems, and rise in need for secure, real-time data sharing across diverse military platforms are also driving the market growth. In addition, rise in geopolitical tensions and cross-border conflicts are prompting governments to modernize their defense infrastructure, boosting the demand for cutting-edge military software solutions. Thus, manufacturers are concentrating on creating high-performance software to address the evolving needs of next-generation defense operations.

However, technical issues associated with military software limit the growth of the military software market. Moreover, development of military software for unmanned aerial systems (UAS) and surge in demand for learning intelligence technology are

expected to provide lucrative opportunities for the growth of the market during the forecast period.
