Narrowband IoT Enterprise Application Market

The narrowband IoT enterprise application market was valued at \$4.3 billion in 2023 and is projected to reach \$19.0 billion by 2032, growing at a CAGR of 17.5% from 2024 to 2032.

Narrowband IoT is a wireless cellular technology that utilizes a low-power wide area network for functioning. This technology operates on existing cellular networks to offer energy-efficient connectivity for different Internet of Things (IoT) applications. Narrowband IoT finds application in industries that require large-scale deployment of connected devices such as manufacturing, logistics, and healthcare.

As several industries are inclining toward low-cost, energy-efficient solutions in their workflow, the narrowband IoT enterprise application market is being driven significantly owing to the extremely low power consumption of the application. In addition, exponential increase in the adoption of IoT devices is propelling the market growth due

to surge in demand for scalable connectivity technology and asset management. With rising smart city projects, the trend of utilizing narrowband IoT enterprise applications in the urban infrastructure is acquiring notable traction currently. To optimize resource management, several cities are focusing on the deployment of narrowband IoT enterprise applications in services such as smart lighting, street parking management, and environmental monitoring.

However, the high latency and low data transmission capability of the application restricts its usage in high-bandwidth functions such as video streaming and real-time communication, which restrains the development of the market. On the contrary, expansion of the autonomous vehicles industry is projected to present lucrative opportunities for the narrowband IoT enterprise application market due to the critical role of the application in vehicle-to-everything communications. A global management consulting firm, McKinsey predicts 12% of new passenger cars to have L3+ autonomous technologies by 2030 and 37% of the vehicles to be incorporated with advanced AD technologies by 2035. Narrowband IoT enterprise application is projected to be necessary to support the infrastructure that facilitates autonomous driving such as traffic management systems and road condition monitoring.
