## **Abstracts**

Organic CMOS image sensor technology uses organic photoelectric conversion layer with high absorption coefficient, providing wider incident light, which prevents highlight clipping in brightness and captures images with rich textures even in dark environment. Factors such as adoption of 8K resolution and global shutter technology and high reliability for broader applications that boost the market. In addition, the features such as wide dynamic range with high sensitivity, hence capturing a clear image with vivid colors and rich textures even in low-light environment also supplement the growth of the market. However, excessive generation of heat in the organic sensor technology, and draining of the battery quickly due to organic CMOS image sensor hampers this stated growth. Furthermore, increase in penetration of image sensors in automobiles and high reliability for broader application are expected to present numerous opportunities for market expansion.

The organic CMOS image sensor market is segmented into image processing, array type, industry verticals, application and region. By image processing, the market is divided into 2D sensor and 3D sensor. By array type, it is classified into linear image sensor and area image sensor. Based on industry verticals, it is further divided into
