Abstracts

Reverse logistics services are being implemented by pharmaceutical, automotive, FMCG and other manufacturers to improve customer satisfaction and reduce adverse environmental impact. Reverse logistics is the process of moving products from final delivery to supplier or manufacturer when the consumer returns them for a range of factors, including incorrect products provided, poor quality, and so on.

Recalls, commercial returns, repairable returns, end-of-use returns, and end-of-life returns are all types of returns in reverse logistics. Recalls are defined as the recalling of a large number of products due to the risk of malfunction due to a missing or broken part. Returns involving the delivery of the incorrect goods are classified as commercial returns, whereas returns involving damaged products are classified as repairable returns. In addition, resalable returned products are classified as end-of-use returns, while products returned owing to regulatory or contractual responsibilities are classified as end-of-life returns.

The reverse logistics market is segmented into return type and end-user. Based on the return type, it is further divided into recalls, commercial returns and B2B returns, repairable returns, end of use returns, and end of life returns. Depending on the end-user, it is fragmented into e-commerce, automotive, pharmaceutical, consumer

electronic, retail, luxury goods, and reusable packaging. Region-wise, the market is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
