Abstracts

Global spine biologics market generated revenue of \$1,644 million in 2015, and is projected to reach \$2,214 million by 2022, growing at a CAGR of 4.3% during the forecast period. Spine biologics are used during spine fusion surgery for the treatment of spinal deformities such as trauma, tumors, degenerative disc disease, and spinal cord injuries. Increase in geriatric population, advantages of biologics such as minimal postoperative time, faster recovery, and their ability to activate cellular growth are the factors that drive the market growth. However, unfavorable reimbursement scenario, higher cost of the bone grafts, and certain ethical issues related to bone grafting procedures are expected to restrain the growth of the market.

Biologics are used during spinal fusion procedure, as they stimulate bone growth formation through inflammatory stage, repair stage, and remodeling stage. Therefore, rise in number of spinal fusion surgery boosts the use of biologics.

Increase in geriatric population is the major factor anticipated to fuel the demand for biologics in future. For instance, spinal disorders such as spinal stenosis is the most common problem in men and women over 50 years. Aging leads to structural alterations in spine such as thickening of the band of the tissue that supports the spine and enlargement of bones & joints, thus resulting in spinal impairment. According to "Eurostat", the population of the European Union (EU) was estimated to be 508.5 million on January 1, 2015. Aged population (65 or over) had a share of 18.9%, which showed an increase of 0.4% compared to the previous year. Therefore, older people who are at a higher risk to develop spinal deformities have increased chances to undergo spinal fusion surgery, which in turn is projected to increase the demand for

spine biologics.
