Abstracts

The steel structure market was valued at \$118.9 billion in 2023, and is projected to reach \$169.7 billion by 2032, growing at a CAGR of 4.1% from 2024 to 2032.

Steel structures refer to buildings, bridges, towers, and other constructions made from steel components such as beams, columns, and plates. These structures serve as essential components of modern engineering and construction due to their strength, durability, and versatility. They offer a high strength-to-weight ratio, making them ideal for a wide range of applications.

The growth of the global steel structure market is driven by the rapid pace of urbanization and the need for new infrastructure projects, such as bridges, railways, and commercial buildings. Moreover, the rise in industrial activities, especially in developing regions, requires robust and durable structures, which is fostering the demand for steel structures. The ability to create complex and customized designs with steel makes it a popular choice among architects and engineers for various construction projects. For instance, the demand for steel structures is considerably increasing in urban areas, particularly for high-rise buildings and skyscrapers, due to their strength and versatility. In addition, they offer superior resistance to natural disasters such as earthquakes, hurricanes, and fires, making them a preferred choice in disaster-prone areas. The increasing trend of sustainability is significantly contributing to market growth. This is attributed to the fact that steel is recyclable and can be reused, aligning with increasing environmental concerns and regulations promoting sustainable construction practices. However, high initial investment required for steel structures and volatility in

steel prices restrain the growth of the global market. In addition, additional costs incurred due to application of protective coatings and maintenance hamper the market growth. This is attributed to the fact that steel is prone to corrosion, especially in humid or coastal environments, thus necessitating the use of coatings. The availability and development of alternative construction materials, such as reinforced concrete, timber, and composites, further limit the demand for steel structures. On the contrary, innovations in steel production and construction techniques improve the efficiency, strength, and sustainability of steel structures are expected to offer lucrative opportunities for the market growth. In addition, the integration of Building Information Modeling (BIM) and other advanced technologies in construction processes enhances the precision and efficiency of steel structure projects, which is anticipated to open new avenues for the market growth during the forecast period.

The steel structure market is segmented by product, application, and region. Depending on product, the market is divided into angles, channels, and rounds. On the basis of application, it is segregated into industrial, commercial, institutional, and residential. Region wise, it is analyzed across North America, Europe, Asia-Pacific, LAMEA
